

IN THE DRAWINGS

New drawings will be submitted upon receiving an allowable claim if appropriate.

IN THE CLAIMS

Claims 2-4 are cancelled and new claims 20- 42 incorporating the disclosure of claims 2-4 are respectfully submitted in order to address 112 rejections as is more clearly set out in the remarks sections which follows.

CLAIMS

20. (New Claim) A method for use with a user interface (GUI) controlled database which may be a plurality of communicating databases in communication with a phone system for controlling telephone communications referred to herein as ^{the} call between parties ^{industry} being a called party and a calling party originating as voice signals converted to an electromagnetic signal in a digital format having at least one data pack of call data comprised of a plurality of digital datum, including at least one digital word comprised of a portion of the digital datum, comprising the steps of:

- 12 a) generating at least one preselected data from the call specific group consisting of data consisting of start date, start time, finish time, length of call, location numbers, pin numbers, name of user, usage of user, phone number called, length of the call, call origin, call destination and combinations thereof;
- b) converting the at least one preselected data to a digital format into a storage compatible format with the electromagnetic signals;
- c) associating in the database the at least one preselected data with the electromagnetic signal;

d) storing in the database a pre-selected group of options associated with the at least one preselected data as at least one associated option from the group of options consisting of connecting the call and continuing the electromagnetic signal, terminating the call electromagnetic signal, storing the call preselected data with a marking means for later retrieval from the database, ^{marks} storing the at least one preselected data with a marking means for later retrieval from the database, playing a recorded message in conjunction with the call, forwarding the call, sending the call to a the user to control the call, sending the call to the user to monitor the call, requesting information from the calling party, requesting information from the called party, storing the at least one preselected data in the data base, storing the electromagnetic signal in the database, determining billing for the call, billing for the call, storing the beginning of the call with a marking means to allow its location in a database, storing the end of the call with a marking means to allow its location in a database, storing the length of the call, ignoring the at least one preselected data, and combinations thereof;

A2 cont
e) comparing the option to the at least one preselected data and associated option from the database;
and

f) effectuating the at least one associated option if the at least one preselected data matches the at least one associated option in the database.

21. **(New Claim)** The method of claim 20 wherein the step of effectuating the option further comprises applying a central processing unit in communication with the database to automatically effectuate the option.

22. **(New Claim)** The method of claim 20 wherein the method further comprises recording the call data and the at least one call specific preselected data in the database for later retrieval.

23 **(New Claim)** The method of claim 22 further comprising the steps of a) storing code

words; b) converting at least one of the **code words** into phonic digital data corresponding to at least one pronunciation for the word; c) grouping a plurality of datum of the call data into data groups comparable to the phonic digital data; d) storing in the database a pre-selected group of options associated **as at least one associated option** with the at least one code word particular word from the group of options consisting of connecting the call between the calling party and the called party and continuing the electromagnetic signal, terminating the call, storing the digital word with a marking means for indicating the code word associated with the at least one digital word, storing the at least one digital word with a marking means for **later retrieval from the database**, playing a recorded message in conjunction with the call, forwarding the call to the user to control the call, sending the call to the user to monitor the call, requesting information from the calling party, requesting information from the called party, storing the at least one preselected data in the data base, storing the electromagnetic signal in a data base, determining billing for the call, billing for the call, storing the beginning of the call, storing the end of the call, storing the length of the call, ignoring the at least one digital word and combinations thereof;

e) comparing the data groups to the phonic digital data;

f) effectuating the at least one associated option if the data groups match the phonetic digital data.

24. **(New Claim)** The method of claim 23 wherein the step of converting further comprises converting the phonetic digital data into at least one digital word of digital data in a desired range of timing and frequency and determining on the basis of a pre-selected percentage of certainty based on the amount of comparable datum based on timing and frequency between the phonetic digital data and the at least one digital word.

25. **(New Claim)** The method of claim 20 wherein the steps of comparing the option and

effectuating the option is done at a remote location for at least one option from the group of options.

26. (New Claim) A method for use with a user interface (GUI) controlled database which may be a plurality of communicating databases in communication with a phone system for controlling telephone communications referred to herein as the call between parties being a called party and a calling party originating as voice signals converted to an electromagnetic signal in a digital format having at least one data pack of call data comprised of a plurality of digital datum including at least one digital word comprised of a portion of the digital datum comprising the steps of:

a) selecting appropriate code words of interest to the user; b) converting at least one of the code word into phonic digital data corresponding to at least one pronunciation for the word; c) grouping a plurality of datum of the call data into data groups comparable to the phonic digital data; d) storing in the database a pre-selected group of options associated as at least one associated option with the at least one code word particular word from the group of options consisting of connecting the call between the calling party and the called party and continuing the electromagnetic signal, terminating the call, storing the digital word with a marking means for indicating the code word associated with the at least one digital word, storing the at least one digital word with a marking means for later retrieval from the database, playing a recorded message in conjunction with the call, forwarding the call to the user to control the call, sending the call to the user to monitor the call, requesting information from the calling party, requesting information from the called party, storing the at least one preselected data in the data base, storing the electromagnetic signal in a data base, determining billing for the call, billing for the call, storing the beginning of the call, storing the end of the call, storing the length of the call, ignoring the at least one digital word and combinations thereof; e)

comparing the data groups to the phonic digital data;f) effectuating the associated option if the data groups match the phonetic digital data.

27. (New Claim) The method of claim 26 wherein the step of converting further comprises storing pre-selected voice digital data corresponding to specific code words converted to digital data in a desired range of timing and frequency in a first database.

28. (New Claim) The method of claim 27 wherein the step of comparing the data groups to the phonic digital data further comprises the steps of entering the code words; creating a database of at least one phonetic pronunciation associated with the code word; using the at least one phonetic pronunciation in place of the code words entered.

29. (New Claim) The method of claim 28 wherein the step of storing at least one pronunciation comprises the step of storing a plurality of pronunciations.

30. (New Claim) The method of claim 28 wherein the step of comparing comprises comparing based on determining on the basis of a pre-selected percentage of certainty based on the amount of comparable datum based on timing and frequency between the data groups and phonetic digital data.

31. (New Claim) The method of claim 26 further comprising the step of retrieving the call from the database by the user and reviewing the call by the user.

32. (New Claim) The method of claim 31 wherein the step of reviewing the call further comprises the step of converting the call to a written document with the added steps of converting the phonetic digital data into code words and displaying the code words.

33. (New Claim) The method of claim 31 wherein the step of retrieving the call further comprises the steps of recording the call data as a series of digital data in a string having at least one length, selecting at least one code word, marking electronically the location of at least one digital word

corresponding to at least one code word within the series of digital data, selecting at least one length of the string including the at least one digital word, recovering the at least one length and reviewing the at least one length.

34. **(New Claim)** The method of claim 33 further comprising the step of setting user defined length for the at least one length.

35. **(New Claim)** The method of claim 34 wherein the length includes at least one word before the at least one digital word.

36. **(New Claim)** The method of claim 34 wherein the length includes at least one word after the at least one digital word.

37. **(New Claim)** The method of claim 26 further comprising encoding the data so that it cannot be altered without modification of the data.

38. **(New Claim)** The method of claim 26 wherein the step of effectuating the option further comprises automatically effectuating the option.

39. **(New Claim)** The method of claim 26 wherein the step of effectuating the option further comprises notifying the user at the GUI and effectuating the option by the user at the GUI.

40. **(New Claim)** The method of claim 26 wherein the steps of comparing the option and effectuating the option are done at a remote location for at least one option from the group of options.

41. **(New Claim)** The method of claim 40 wherein the steps of comparing the option and effectuating the option are done at the phone location for at least one option from the group of options.

42. **(New Claim)** The method of claim 26 further comprising the step of generating at least one call specific preselected data from call specific group consisting of data consisting of start date, start time, finish time, length of call, location numbers, pin numbers, name of user, usage of user, phone

number called, length of the call, call origin, call destination and combinations thereof and storing in the database a pre-selected group of options associated with the at least one code word particular word from the group of options as at least one associated option consisting of connecting the call and continuing the electromagnetic signal, terminating the call electromagnetic signal, storing the call preselected data with a marking means for later retrieval from the database, storing the at least one preselected data with a marking means for later retrieval from the database, playing a recorded message in conjunction with the call, forwarding the call, sending the call to a the user to control the call, sending the call to the user to monitor the call, requesting information from the calling party, requesting information from the called party, storing the at least one preselected data in the data base, storing the electromagnetic signal in the database, determining billing for the call, billing for the call, storing the beginning of the call with a marking means to allow its location in a database, storing the end of the call with a marking means to allow its location in a database, storing the length of the call, ignoring the at least one preselected data, and combinations thereof; comparing at least one associated option to the at least one preselected data; and effectuating the at least one associated option if the at least one preselected data matches the associated option in the database.

43. The method of claim 42 wherein the call specific data comprises a PIN number of the origin user.

44. The method of claim 43 comprising the step of obtaining the PIN number from a biological person specific marker for the calling party.

REMARKS
